

## Superior FIRE

### How to Use Superior FIRE

Superior FIRE is a professional-grade, penetrating enhancer designed to permanently enhance the appearance of natural exotic stone and seamlessly blend edge profiles with polished surfaces. For optimal results, follow the instructions below:

#### Application Directions

- Always TEST a small, inconspicuous area on each stone type to confirm appearance and absorption before full application.
- Ensure the stone surface is thoroughly cleaned and completely dry before applying ICE.
- Do not apply in direct sunlight to prevent uneven absorption or premature drying.
- Surface temperature during application should be between 50°F–85°F (10°C–29°C).
- Apply ICE evenly using a clean towel, sponge, or paintbrush.
  - Do not pour ICE directly onto the stone.
  - Avoid pooling or puddling, which can lead to streaks or uneven finishes.
- Wipe the surface dry within 5–10 minutes of application to prevent residue or buildup.
- FIRE is a permanent, penetrating treatment and cannot be removed by scraping or stripping once applied and absorbed.

#### Important Notes

- Suitable for indoor and outdoor use
- VOC compliant and free of harsh odors
- Ideal for matching edge profiles to polished surfaces on marble, granite, limestone, quartzite, and more.
